Here is some code:

```
y0, v0, t = 10.0,0.0, 2.0        % defines the variables
y = y0 + v0*t −4.9*t**2          % computes the y position
print y                          % prints out the value of y
```

Hurray!
